

# **ENTstatistics**Tumour module

### What does the database offer?

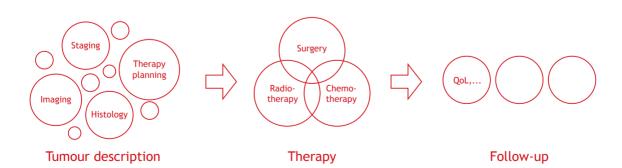

With the aid of the ENTstatistics tumour module, it is possible to readily manage detailed records on patients with oncological disorders in the head and neck regions. Information relating to case history, diagnosis, staging, therapy and follow-up can be entered with just a few mouse clicks. Definitions are generally based on standardised criteria (WHO, UICC etc.). However, these can be individually modified or extended when required; e.g. in the case of clinical studies.

# Special features that facilitate clinical routine

The tumour module offers specially designed templates that make it easier to document data on surgery, radiotherapy

and chemotherapy. An exclusively designed ENTstatistics questionnaire mode can be used to register the subjective status of patients. A special follow-up template simplifies the monitoring of therapy outcome over time and indicates if renewed treatment is necessary.

MRT and CT images can be quickly and conveniently incorporated in patient files by means of drag and drop. A mouse click is all that is required to scan in clinically relevant graphics. Alternatively, these can be generated directly with the help of the ENTstatistics graphics editor.

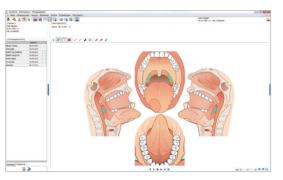

# Rapid and versatile evaluation

Numerous options support the medical evaluation of stored patient and treatment data. Only a few mouse clicks are needed to search the database for treatments with specific attributes. Matching cases are displayed and can be further analysed. It is also possible to undertake a Kaplan-Meier survival analysis during comprehensive patient evaluation. The acquired data can be exported in Excel format.

## Advantages at a glance

- Extensive support for therapeutic measures and consultations
- Analysis of therapy outcome possible at all times
- Authoritative database for clinical studies
- Improved management of follow-up
- · Provides basis for quality control

**Dr. Marc Unkelbach**Assistant Medical Director ENT Clinic
Frankfurt Höchst Hospital, Germany

"The ENTstatistics tumour module is an enormous help when it comes to the documentation and evaluation of the outcome of our cancer therapy strategies.

Thanks to the fact that ENTstatistics can be adapted to our specific therapy regimens, each individual treatment can be entered with minimal effort. Evaluation can be undertaken at any time based on the parameters that are of specific interest to the case."
