

Diagnostic Manager

Edition Pro

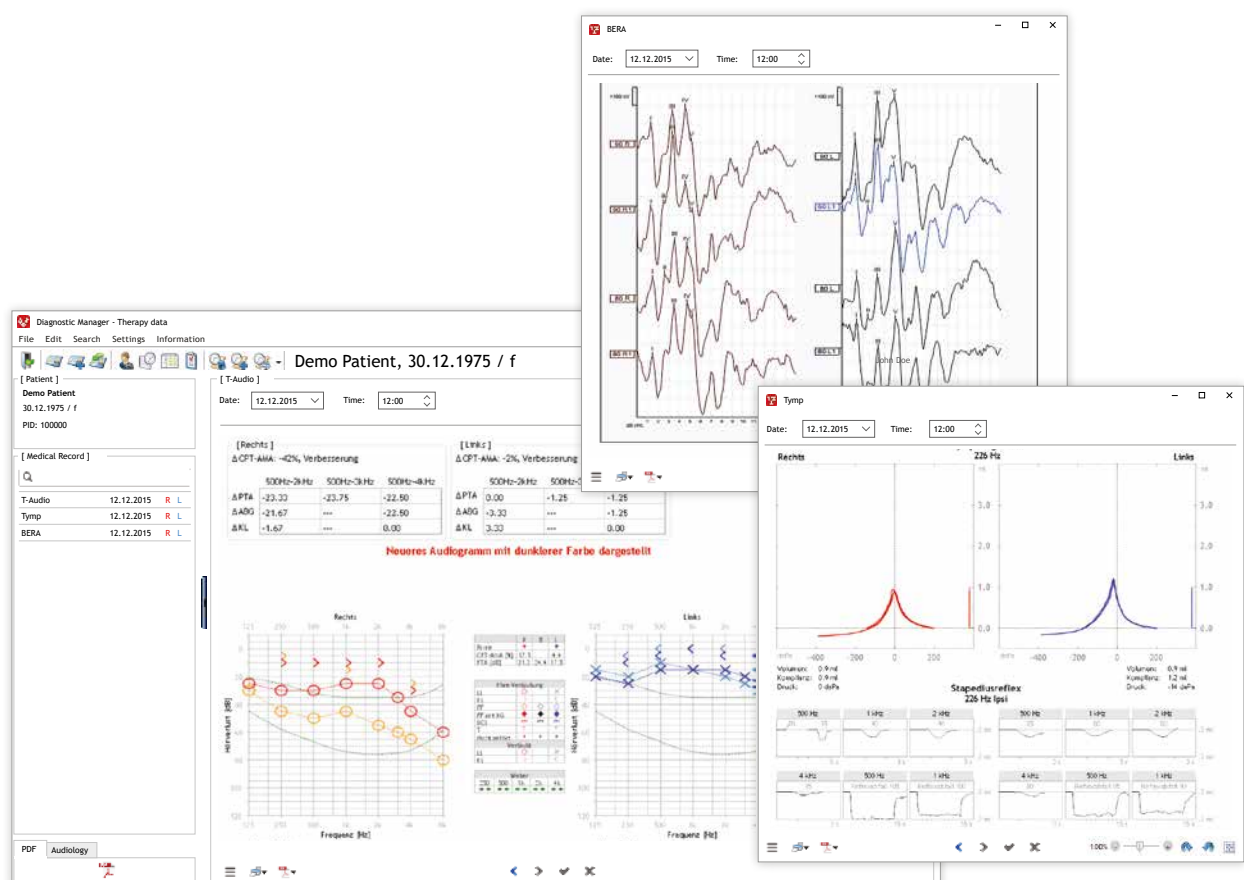

1 Database for all ENT diagnostic results

The perfect assistant for the management of your examination findings

Diagnostic Manager is a database program that has been specifically designed for use by specialist ENT practices and hospitals; it allows the results of various diagnostic procedures to be viewed and saved. You can easily and rapidly load the required information at all workstations and also print these as necessary.

Diagnostic Manager has been developed in collaboration with leading manufacturers of

ENT-related devices. The know-how gained by INNOFORCE with the aid of its successful database program ENTstatistics, that has been in use since 2006, is the basis of the program. It utilises the powerful MS SQL server technology that is approved for use and also widely employed in medical practices and hospitals.

Simultaneous presentation of different findings

Optimal integration

Integration in practice software systems

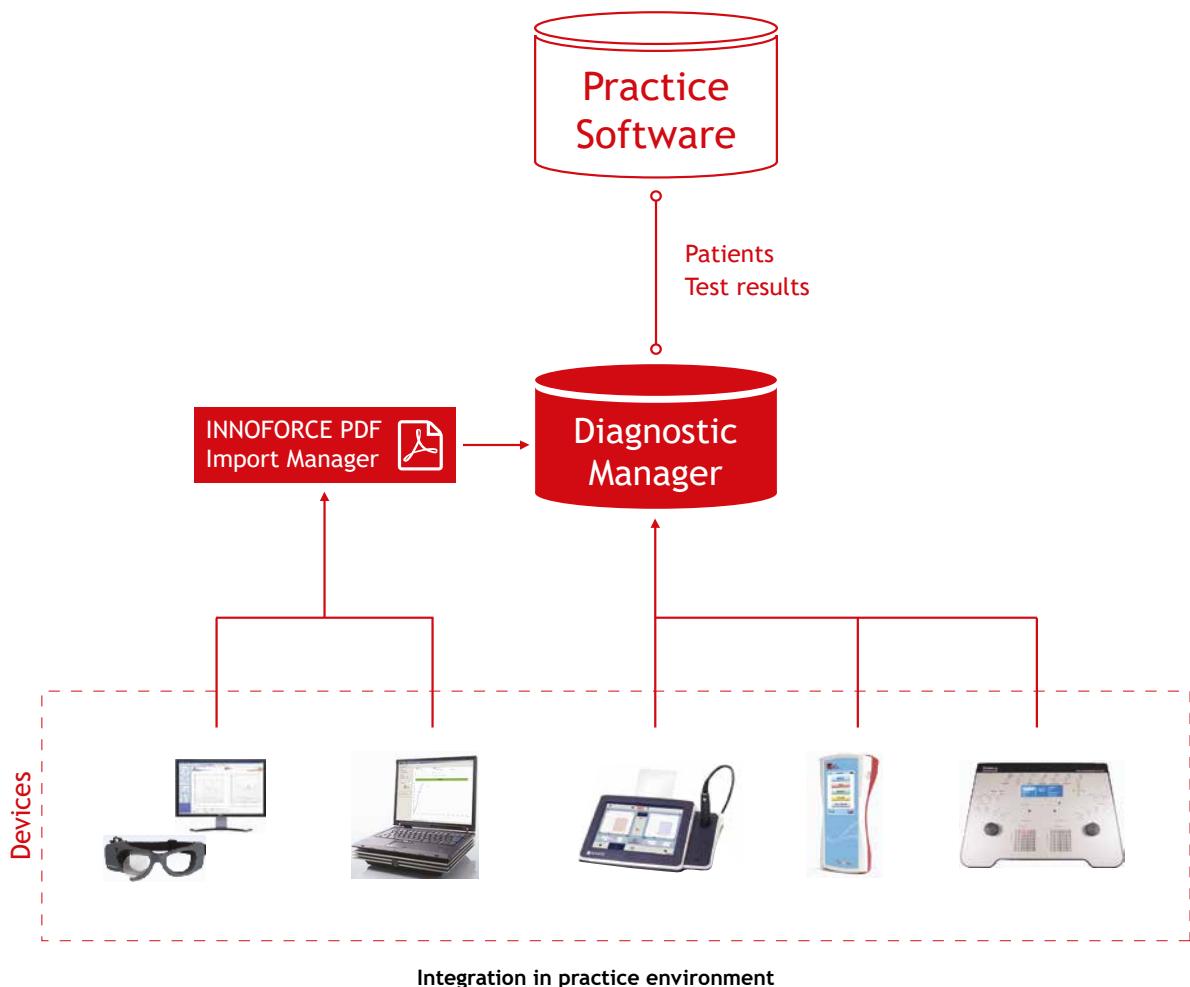

By means of a GDT interface, Diagnostic Manager can be readily incorporated in existing practice programs (such as Turbomed, Medistar and others). You can thus continue to use your practice program to access the required results and display them.

Migration of existing data

In addition to interfaces that make possible the prospective documentation of results, INNOFORCE also offers data migration services, for example, for audiogram results from existing databases.

The benefits in brief

- One single database for all ENT examination results
- Simple documentation of your diagnostic findings
- Easy access to data from all workstations connected to your network
- Clear results display
- Optimal integration
