

Eye Clinic Manager

THE eye database

simple · powerful · straightforward

THE eye database

The Eye Clinic Manager (ECM) is a database program designed to help ophthalmologists manage their patient information and also provides them with a range of new options.

It not only systematically documents all relevant aspects of eye examinations and treatments, but also enables users to statistically analyse these.

User-friendly and time-saving

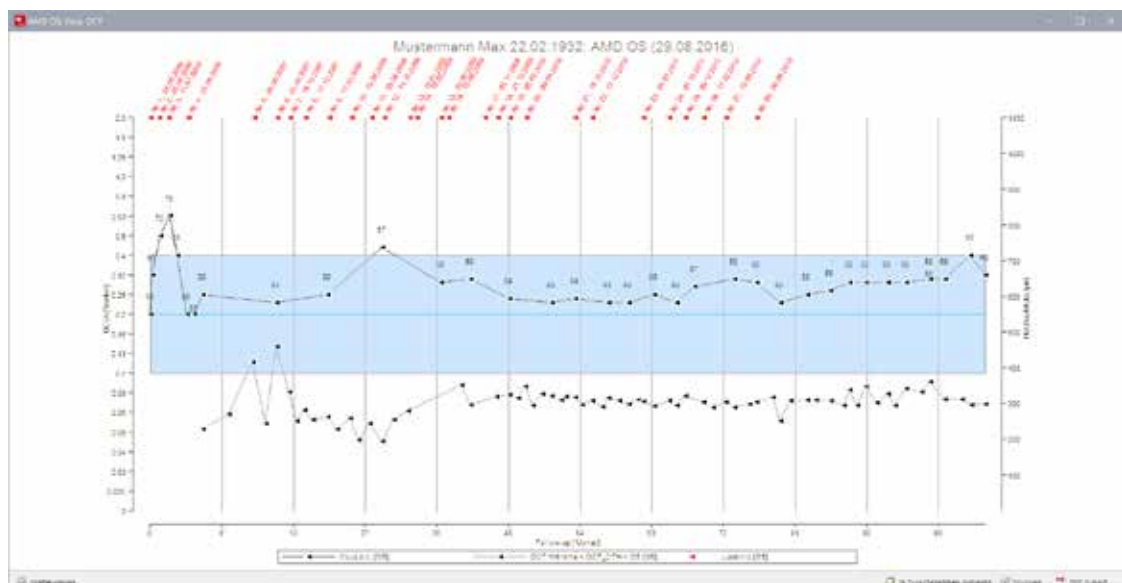

During day-to-day medical routine, it is usually only possible to methodically record data when the database system is easy to use and has been designed to be user-friendly. The ECM not only offers these advantages, but makes it possible for users to rapidly document treatment data, such as measurements, consultation notes, surgical OP reports and sketches in a logically structured form. The therapy data stored in the ECM can be searched and processed on the basis of many different criteria. Users particularly appreciate the extensive possibilities for visualising findings over time.

Maximum flexibility thanks to the Admin Tool

The Admin Tool is a separate program that allows users to flexibly modify the criteria configuration to their individual requirements or research interests should these change over time.

The many benefits of the ECM

- Simple, rapid and clearly structured documentation and processing of diagnostic and treatment data
- Evaluation options for research purposes; e.g. for clinical trials, for cost optimization and for submission to authorities, legislative bodies and funding/insurance organisations
- Fully fledged system that has been used successfully in daily routine for many years and is subject to continuing development
- Time savings thanks to wide-ranging functions for generating reports
- Patient and/or measurement-specific task management

Automatically generated progress charts for AMD treatments

Individually customised and integrated

Flexible and individual interfaces

The ECM can be easily integrated in an existing hospital information system (HIS). It can be used to view relevant eye treatment and statistical data directly from the HIS. The corresponding workload and costs are minimal as the ECM has a variety of interfaces. It is possible, for example, to automatically import:

- Personal patient details and case data (HL7)
- Ophthalmological measurements data from numerous devices
- Images and PDF files
- DICOM data

Export of results and treatment data to the HIS

The ECM also has interfaces that provide for the export of data so that results obtained in the ophthalmology clinic can be automatically uploaded to the HIS. Recently generated measurements, for example, can be made accessible from all workstations in a hospital in the form of PDF files.

Migration of original databases and customisation

In addition to interfaces that provide for the prospective documentation of data, INNOFORCE also offers a data migration service

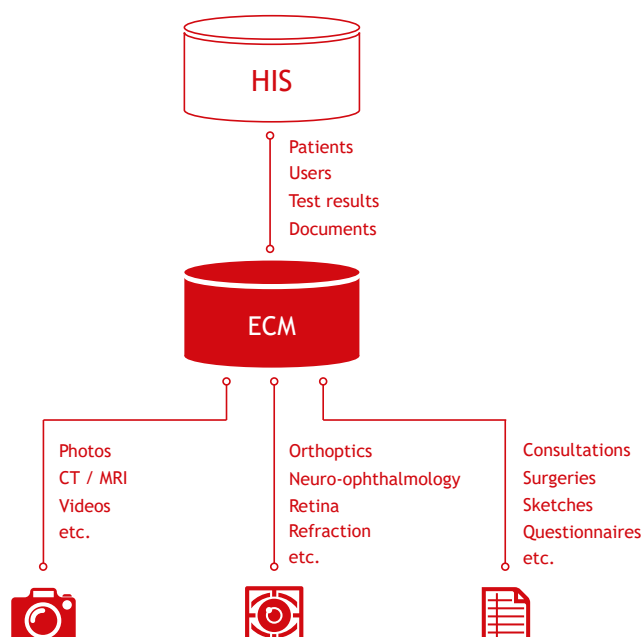

to customers who want their previously documented measurements and OP records to be integrated in the system. Thanks to the close dialogue between the highly qualified development team at INNOFORCE and the specialists at your ophthalmology clinic and hospital IT department, the ECM can be optimally adapted to your requirements and integrated into the hospital's existing systems landscape. It is the objective of the highly qualified team of developers at INNOFORCE to find solutions that are ideally suited to the needs of users. If necessary, the program can also be individually modified and expanded.

Training and support

Users who invest in the ECM not only acquire a top quality program but are also given the know-how to use it to maximum advantage. Our INNOFORCE support team is there for you.

We offer:

- Help with integration and configuration
- Training of personnel
- Detailed product documentation
- Telephone, email and remote desktop support

“ *Eye Clinic Manager - THE expert system for the documentation and evaluation of eye therapies.* ”

Quality enhancing features

- Relevant eye therapy data archived in their entirety with a clear structure
- Simple gathering of the results from all examination devices
- Rapid location-independent access to data
- Clear visualisation
- Optimal integration into existing hospital infrastructure

Cost-saving features

- Easy and quick operation
- Significant time saving for evaluations
- Report generation with a single mouse click
- Flexible integration into existent systems
- Based on a sophisticated system which is being continuously improved

Prof. Misha Pless

form. Lucerne Canton Hospital
Lucerne, Switzerland

“I have been using the ECM program since 2014 to my great satisfaction. I find the innovations to be of high quality and the team which supports the software to be responsive to new requests.”

From my occupation in the USA I know large, complex home-grown electronic medical record systems used in the Harvard Medical School associated hospitals. I find the ECM to be comparable in scope and user-friendliness to those very large and complex programs which were previously familiar to me, before I moved to Switzerland.

I highly recommend the ECM program for the use in ophthalmology.”
